Summation current transformer

Description

Summation current transformers are used to add secondary currents from several main inverters. They are designed to combine several synchronous alternating currents of equal phase relationship with each angle of the phase difference. It is thus possible to record the total consumption with just one measuring instrument.

Properties

- Summation of secondary currents to several main converters
- This allows access of the measurement for a measuring instrument
- At the output a standardized measuring signal is available
- Burst-resistant plastic housing made from polycarbonate
- Hardly inflammable and self-extinguishing according to UL94 V0
- Terminal protection, IP10
- Nickel plated terminals with plus/minus screws
- Various mounting options such as wall mounting or DIN rail
